

ARCHIVE DATAS TO S3 GLACIER

Login to aws account > search for aws s3 glacier in services.

Select create vault option.

Click on the option create vault and select the region and enter name of the vault.

The screenshot shows the AWS Management Console for the eu-central-1 region. The 'Create Vault' wizard is open, and the first step, 'Vault Name', is active. The left sidebar lists the steps: Step 1: Vault Name, Step 2: Event Notifications, Step 3: Event Notification Details, and Step 4: Review. The main content area is titled 'Welcome to Amazon S3 Glacier' and provides information about archives and vaults. It includes a 'Region' dropdown menu set to 'EU (Frankfurt)' and a 'Vault Name*' text input field containing 'vault name'. At the bottom right, there are 'Cancel' and 'Next Step' buttons. The footer contains a feedback link, a language selection link, and copyright information for Amazon Web Services, Inc. or its affiliates.

Create Vault

Step 1: Vault Name

Step 2: Event Notifications

Step 3: Event Notification Details

Step 4: Review

Welcome to Amazon S3 Glacier

Data is stored in S3 Glacier in "archives." An archive can be any data such as a photo, video, or document. You can upload a single file as an archive or aggregate multiple files into a TAR or ZIP file and upload as one archive.

A single archive can be as large as 40 terabytes. You can store an unlimited number of archives and an unlimited amount of data in S3 Glacier. Each archive is assigned a unique archive ID at the time of creation, and the content of the archive is immutable, meaning that after an archive is created it cannot be updated.

Vaults allow you to organize your archives and set access policies and notification policies. Get started by giving your vault a name. You can then create your vault now or click **Next Step** to set up your vault's properties.

Click on the next step. In this step we can enable notification like to notify when the upload is completed.

The screenshot shows the AWS Management Console for the eu-central-1 region. The 'Set Event Notifications' wizard is open, and the second step, 'Event Notifications', is active. The left sidebar lists the steps: Step 1: Vault Name, Step 2: Event Notifications, Step 3: Event Notification Details, and Step 4: Review. The main content area is titled 'Set Event Notifications' and provides information about notifications. It includes three radio button options: 'Do not enable notifications' (selected), 'Enable notifications and create a new SNS topic', and 'Enable notifications and use an existing SNS topic'. At the bottom right, there are 'Cancel', 'Previous', and 'Next Step' buttons. The footer contains a feedback link, a language selection link, and copyright information for Amazon Web Services, Inc. or its affiliates.

Create Vault

Step 1: Vault Name

Step 2: Event Notifications

Step 3: Event Notification Details

Step 4: Review

Set Event Notifications

You can choose to have notifications sent to you or your application whenever certain S3 Glacier jobs complete. Notification messages are sent by the Amazon Simple Notifications Service (SNS).

You specify the Amazon SNS topic to use for job completion notifications by using the Amazon Resource Name (ARN) of the topic. You then select which types of S3 Glacier jobs can trigger the sending of a notification upon completion of the job. Applications or users that subscribe to the Amazon SNS topic receive a notification message when a job of the type you select completes.

☒ **Do not enable notifications**
You can enable, set up, and change your notification settings later.

☐ **Enable notifications and create a new SNS topic**
Enable notifications and create a new Amazon SNS topic to send the notifications.

☐ **Enable notifications and use an existing SNS topic**
Enable notifications and enter an existing SNS topic to send the notifications.

Click on the next step and submit.

The screenshot shows the AWS Management Console interface for creating a Glacier vault. The top navigation bar includes the AWS logo, 'Services' menu, a search bar, and the current region 'Frankfurt'. The left sidebar shows the 'Create Vault' wizard progress: Step 1: Vault Name, Step 2: Event Notifications, Step 3: Event Notification Details, and Step 4: Review (current step). The main content area is titled 'Review' and contains a warning: 'Make sure the following information is correct before you choose **Submit**. To go back and make changes, choose **Previous**.' Below this, the configuration details are displayed: 'Region' is 'EU (Frankfurt)' and 'Vault Name' is 'vault-name'. At the bottom right of the review section are three buttons: 'Cancel', 'Previous', and 'Submit'. The footer of the console shows 'Feedback', a link for language selection, copyright information for 2022, and links for Privacy, Terms, and Cookie preferences.

Now install aws cli on the server.

```
#sudo pip install awscli
```

```
#aws glacier create-vault --vault-name server_backup --account-id -
```

```
#aws glacier upload-archive --account-id - --vault-name server_backup --body  
file.tar.gz
```

If its large file the upload it by splitting the file into 4 GB

```
#split -b 10240M file.tar.gz "file.tar.gz.part"
```

```
#aws glacier upload-archive --account-id - --vault-name server_backup --body  
demo1.bidcars.gr.tar.gz
```

Enter the name of the vault.

Need to take the output after uploading every single files.
